ACCESS Technologies will introduce a revised 10" Marine Woofer at the upcoming CES 2001 in Las Vegas, January 6th through 9th, 2001. The company's booth is located in the Las Vegas Convention Center - Mobile Electronics Section at booth No. 22103.

ACCESS Technologies is introducing the MAW-10S with significant improvements from the previous model.

The speaker is highlighted by a heavy-duty magnet and motor mechanism that features a vented T-shaped pole piece and a bumped back plate for deep excursions and enhanced bass performance.

The entire motor mechanism is sealed with a 400Hr. UV. stable plastic cover. Gold plated binding posts compliment the new structure and are directly frame mounted.

The new proprietary frame design features glass reinforced high-temp polypropylene construction able to with stand the ASTM 400Hr. UV stability test.

A new plastic grille assembly is also made of high-temp polypropylene and is also 400Hr. UV. stable and corrosion free.

The same high performance is available in both sealed and unsealed (or vented) enclosures, such as under seating or in storage areas.

The 10" Polymica cone and butyl rubber surround, heavy gauge 2" voice coil, and 30oz magnet combine for an excellent sound and a maximum power handling of 300 watts. For more information and a complete catalog on the ACCESS TECHNOLOGIES line of products;
