ACCESS Technologies will introduce a new 6.5" Marine Audio Speaker System at the upcoming CES 2001 in Las Vegas, January 6th through 9th, 2001. The company's booth is located in the Mobile Electronics Section at booth No. 22103.

ACCESS Technologies is introducing the MAS-6100 Coaxial Speaker System, with significant features that make it suitable for use in the challenging environment of marine applications.

The speakers utilize high temperature plastic material that is naturally corrosion free and 400Hr. UV stable.

The grilles are also made from high temp plastic material, which means that all ASTM standards for UV stability are met.

In the critical driver component area the speakers feature only the best in materials and design combined for excellent sound quality reproduction. The cone material is high temp polymica, with a butyl rubber surround, both of which combine with the motor mechanism in a well balanced speaker.

The 10oz. magnet and precision wound voice coils of flat CCA wire combine with large gauge tinsel leads, that are silicon covered to further the speakers performance.

The speakers also feature gold-plated terminals, easy mount speaker/grille "hole through" design and standard 6.5" mounting hole patterns for convenient applications. The center mounted Tweeters feature swivel capabilities for perfect imaging and directionality of the high frequency sound range.

For a complete specification sheet and performance parameters contact the company at;

ACCESS TECHNOLOGIES, call or FAX the numbers listed above.
